Report of Digital Literacy Awareness Quiz

To complete this project, I utilized Google Forms as the primary platform for building the quiz, along side I used notepad to create README.MD file. Google Forms provided an intuitive interface for structuring diverse question types, transition between physical and digital spaces.

Through this process, I practiced instructional design by drafting 7 questions that balance technical knowledge (like 2FA and Phishing) with critical thinking and digital ethics. I also practiced documentation by creating a structured README file, ensuring the project is clear and reproducible for others.

Academically, these tools are invaluable. Mastering Google Forms allows me to conduct efficient primary research and data collection for future group projects or lab reports. Furthermore, developing a "security-first" mindset through the quiz content ensures I can protect my own academic data and research from cyber threats. Understanding how to bridge information—from a simple URL to a TEXT based link or a README—enhances my technical communication skills, which are essential for presenting complex ideas clearly in any professional or academic setting.
